

"M^r. that Thomas Davis my tennant at Shelton told me in Shelton's fyld conyng from Bycke the iijth day of Aprell a^o. 1543, before W^m. Tydde' theld' dwelling at or by Wodecote—That he hathe hard of other auneynt men dwellyng in Shelton (where the said Thom^s. now dwelleth) unto the m'ckett and etc. was throughe the grounde that is now the folde or courte aganste the gret mansion there; belonging to Mytton, esquier, and of him holden by Nycolas Purell of Salop, and for farther spares thereof the part of the said courte extendyng from my said house in Shelton towards the highe strete of the said tounne.

"Farther he saythe, that by cause the grounde wherby *the said gret oke* standeth is moche more waye and handson' onto the moost of the said filds of Shelton, m'ckett mylle, and moost of y^r convenient to resort to, and for that oon laude of grounde belongyng to my said house stode right and next to the southe east ende of my saide house—which said laude of grounde did lye and dothe streight upon the gret oke," &c.

This extract will suffice to prove that the Shelton Oak was esteemed *a great* one within 140 years of the battle of Shrewsbury, and an object of remark to old people *long before* that period.

The circumference of this tree at one foot and a half from the ground is thirty-seven feet, and at five feet from the ground it is twenty-six feet.

PLATE XVIII.—THE BOUNDS-PARK OAK

This beautiful tree stands in the full pride of symmetry and vigour, in Bounds-Park, near Tunbridge, the residence of the Earl of Caledon; from the windows of whose mansion it presents an object perpetually to the eye to admire the elegance of its form, and the redundancy of its foliage. To the casual observer of the view of one tree may seem much like the view of another; and that a forest itself is more calculated to interest the imagination by the greatness of its aggregate, than to interest it by the variety of its detail: but it is different with the ardent contemplatist of Nature; with him, as is well observed by St. Pierre, (himself an unwearied admirer of her charms), "every tree has an expression of its own, and every group has its own." He loves to trace in each individual specimen, its peculiar anatomy and character. Every winding branch, every shooting stem, has a charm for him; and he is interested throughout each stage of the existence of the wonderful vegetable structures, from the tender sapling, to the leafless withered trunk.

The age of the Bounds-Park Oak is not known; but it appears to be in its prime, and zenith of perfection, and bids fair to ornament the spot on which it stands for several centuries to come. Its circumference, at five feet above the ground, is twenty-two feet; at twelve feet, where the stem divides, it is sixteen feet nine inches. It is sixty-nine feet in height; and the extent of the boughs from east to west is one hundred and fourty feet, and the solid contents of the tree are eight hundred and ninety-two feet.

PLATE XIX.—THE MOCCAS-PARK OAK.

This ancient tree, which at three feet from the ground is thirty-six feet in circumference, is in the full prime of its age, and stands on the banks of the Wye, in Herefordshire, the seat of Sir George Amyand Cornwall, Bart. traces his ancestry from Richard, second son of King John, Earl of Cornwall, and King of the Romans. The estate is fraught with historical associations, which extend themselves with pleasing interest to this day. "monarch of the wood," among whose boughs the war-cries have often reverberated in former ages, and witnessed many a fierce contention for the domains on which he still stands, in venerable, though declining majesty, surrounded by aged denizens of the forest, the oldest of whom, nevertheless, compared with himself, but as of yesterday.
